Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 12; Fig 1; 65pp; English.
073087 encodes R62768 bovine metalloproteinase inhibitor (MI), it may be used to inhibit tumour cell dissemination and for treating rheumatoid arthritis, dystrophic epidermolysis bullosa; emphysema and osteoporosis. The DNA may be used to detect MI gene disorders. Sequence 1045 BP; 219 A; 350 C; 311 G; 165 T;

                                                                                                                                                                                                                                                                                                    resulting from matrix metallo-proteinase activity and in diagnosis, detection and purificn.

Suisclosure; Fig 7; 54pp; English.

TIMP-2 was isolated from human melanoma cell-conditioned media and the mino acid sequence determined. A probe was synthesised based upon the protein sequence information. It was used to screen a LambdaGem-4 cDNA library prepared from human melanoma cells. 239 positives were identified from a total of 750,000 plaques screened. Further analysis and screening with additional probes eliminated most of the clones. Clone pSS38 was isolated and the nucleotide sequence of the cDNA insert was determined. The deduced amino acid sequence showed excellent agreement with that derived by directly sequencing the TIMP-2 protein.

TIMP-2 metalloproteinase i
matrix metalloproteinase i
                                                                                                                                                                                                                                                                                                                                                                          1009
         New matrix metallo-proteinase inhibitor - used to treat dise
resulting from matrix metallo-proteinase activity and in
diagnosis, detection and purificn..
Disclosure; Fig 6A; 54pp; English.
TIMP-2 was isolated from human melanoma cell-conditioned med
the maino acid sequence determined. A probe was synthesised
based upon the protein sequence information. It was used to
                                                                                                                                                                                                                                                                    Synthetic.

Both were sequenced and fou to encode CSC-2IK (-TIMP-2), a novel metalloproteinase inhibitor. See also US7317407 and W09010228. See also US7317407 and W09010228. See also QSG5937, R067456. The present sequence is that of the human small tissue inhibitor metalloprotease 2 (TIMP2) DNA. Expression of this sequence is negatively correlated with brain tumour malignancy, i.e. relative expression levels are: normal brain tissue > astrocytoma > anaplastic astrocytoma > glioblastoma. By determining the level of TIMP 2 expression in human brain tissue, the malignancy of cerebral tumours can be evaluated.

Bisclosure, Fig 6B; 54pp; English.

TIMP-2 was isolated from human melanoma cell-conditioned media and the amino acid sequence determined. A probe was synthesised based upon the protein sequence information. It was used to screen a LambdaGem-4 cDNA library prepared from human melanoma cells. 239 positives were identified from a total of 750,000 plaques screened. Further analysis and screening with additional probes eliminated all but two clones (pSS15 and pSS18). Both were sequenced and found to encode CSC-21K (=TIMP-2), a novel metalloproteinase inhibitor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 C A single-stranded DNA (or its complementary strand or the corresp.
C double-stranded DNA) which comprises one of the 7837 "GS" sequences
C given in T19001-T26837 and which is able to hybridise to part of
C human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
C sequences were obtained from 3'-directed cDNA libraries prepared
C from various human tissues; synthesis of cDNA was initiated from the
C 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
C untranslated sequence is unique to a particular mRNA species, almost
C all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
C is constructed so as to reflect accurately the relative abundance of
C different mRNAs in the particular tissue from which it was derived.
C The appearance frequency of a given GS in a cDNA library can be
C determined (esp. using primers and probes derived from the GS
C sequences) as a means of diagnosing abnormal cell function or for
C recognising different cell types.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A full-length cDNA clone (T34433) codes for human tissue inhibitor of metalloproteinase-4 (TIMP-4) (R98265), which was identified as a novel member of the TIMP family. The cDNA clone was obtd. from a cDNA library derived from an early stage human brain. It can be used for prodn. of recombinant TIMP-4, using e.g. Escherichia coll, COS or insect cell hosts. It can also be used in gene therapy, or to design probes for use in diagnosis of a disease, or a susceptibility to a disease, related to a mutation in the human TIMP-4 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             diseases,

Natriuretic protein receptor B for diagnosis and treatment of kidney failure, heart failure, hyperaldosteronism, glaucoma etc. Claim 3; Fig 1; 49pp; English.

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the protein, of the protein, opt after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated MrRB analogues. The protein (or variants) can be used in treatment of 114,952).
                                                                                                                                                                                                              (GETH ) GENENTECH INC. Chang M, Goeddel D, Lowe WPI; 91-036711/05.

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodn. of the protein, opt. after being mutated to produce
